The author has had a personal role in the application of the concepts of biotechnology to the musculoskeletal system. He has pioneered the techniques of molecular biology and genetic engineering in the musculoskeletal system in the laboratory and in patients to improve the results of autogenous reconstruction for the repair of rotator cuff tears, fractures, and articular cartilage defects. Over the last few years, we have focused in developing improved biological agents to augment the beneficial effects of the autogenous and allogeneic tissues. Studies have been designed to engineer new tissue forms to augment healing. These include injectable materials to encourage graft maturation and incorporation, to modulate differentiation, and to improve healing. In addition, sophisticated cultured cells and gene fragments, and gene products have been tried as potential vehicles to enhance healing and repair defects. A better understanding of the mechanisms of tissue repair and an improved understanding of the biology of tissue engineering are providing the basis for the development of more effective augmentation techniques. This monograph reviews the state of the art, and suggests strategies for future investigations in the field of tissue engineering.Just a quick preview of a new kit that can be found here. Just in time for my upcoming move. It's a motion activated camera kit which supports up to 6 channels. The kit doesn't include power supply or cables. All the 3D printed parts are made of PLA. I was excited to receive my new printer where I live in Norway! I have no printer at home atm so it was a good excuse to build my own and also solve the environmental problem with shipping. Handsome enough? I'm thinking of making this printer available to the public via indiegogo. I will not only print the blueprints free, but also make the files available on my site and on github as open source. Disclaimer: all 3D printed parts are made of polylactic acid. Demo: the "traffic light" is still in design (not printed and working). Thanks to all the ones who have been 6d1f23a050
