Photoshop's selection tools also let you isolate anything that's not absolutely perfect, as well. It's important to do this before creating images on your computer, as defects can be a pain to fix later on. One of Photoshop's greatest assets is its set of adjustment and modification tools. These tools reduce the need for layers and allow you to experiment with the way you want to set up your work. The neural network (it's a fancy computer term for layering) helps you get the best results from your work. It learns how you want your work to look, and then does it for you. To top it all off, the software will support high-dynamic-range imaging, which is a technology that eliminates the need for a traditional TIFF file. The technology might not actually be used to create HDR images (which are frequently created by image editors, rather than managed through the software), but the workflows that industry standard HDR file creation entails will work through the web, too. The new features will include a new object selection tool and improved level of control over layer visibility for more efficient editing. There's also the ability to use the selection tool to pull areas of an image and remove them, and to apply image adjustments to a photo that a user chooses; for example, you can add warmth and red filters to the people in a book photo. The tool can also be used to create a composite from various photos, for instance, and edit overlapping objects together. Other new features include content-aware fill, some innovative libraries, the ability to color-correct apps, create attractive web experiences and create CDE files. You can watch videos on YouTube and access the news on the web seamlessly--parts of the objective-c programming language are being brought over as well as the blueprints animation tool.
