How do you alter the color of a photo? Adobe's answer seems to be to let you accomplish it by simply using the Tint feature in Express. In real life I handle any change in colors by creating a new layer for a semitransparent color adjustment layer. But if I'm creating a full image replacement, I will alter the color of one or more layers and then sometimes layer masks as well. The most powerful part of the tool is the Color Picker, which enables you to define and refine non-destructively anything from a specific color to a gradient. This works in Quick Fix as well as with all other color adjustment tools like Levels, Curves, and the Hue/Saturation dialog. It also works with Editing, where you can use it in combination with any filter and the 's Save for Web and Devices feature. You simply select the color you wish to use and apply a filter, save the image, and then you can pull up the color panel just as you would for any other image. You can use it with all the above mentioned tools, and also the Curves or Levels dialog box. I think it would be a better idea to let a user select a color from a color picker and then import the color to the current image. While this allows one to clearly select a particular color, as well as pull it out of the picker for reuse later in an image, it is time consuming to do this before each and every image, so if only Photoshop had such a function. The Color Picker is a great tool, and I just wish there was a faster way to use it.

Photoshop's cutting-edge web features add an entirely new dimension to workspaces, especially if you're already using Photoshop on your desktop or mobile device. Photoshop Elements 23.4 adds improvements across the board to make web editions with a web browser even more powerful. New features such as video compositing and Photoshop Sketch — a web-based illustration tool — help to bring the creative process to a new level. Adobe Sensei, introduced with Creative Cloud, is a new AI module that helps make more predictable decisions about overworked retouching tasks such as removing blemishes and adding depth to photos. This AI module achieves incomparable results in many instances while also saving time and effort. "Photoshop is already a best-in-class tool for so many creative people and professionals. Adobe's global customers are demanding even more powerful desktop editing features delivered on more devices and using more efficient processes," said Peter Schelhaas, vice president of technology development for the Adobe Product Innovation team. "Adobe modernized many aspects of Photoshop with the new features and enhancements in this release, and we made it easier for consumers and professionals to collaborate across new device and operating systems." Adobe Photoshop GPU does not support textured surfaces but it does enable users to create more natural-looking materials. There is no need of using textures to create a styled (or natural) look for the image. This technology is being developed in conjunction with Adobe's partnerships with Autodesk and Dassault. With GPU, photo manipulations on skin is now far more realistic, and looks much cleaner and more natural.

Photoshop CC 2017 adds a number of features, such as faster masking, new slide, and gradient tools, as well as four Photoshop-inspired plug-ins for Microsoft Office documents and improvements to curves, a brand new Black & White adjustment, and several other enhancements. The new Photoshop can visualize the raw data of a production pipeline so designers and their collaborators can see what's going on across the board without leaving Photoshop. With Share for Review, people can view workspaces and data even while they're working offline, and collaborate in real-time on any projects across any surfaces. Share for Review gives people on the collaborative team the ability to view the project, without relying on a live connection. This

removes the need to synchronize two or more instances of the app to ensure everyone is on the same page and that any changes to Photoshop have not been lost. Document Exchange caters to the most critical and important need for collaboration — the ability to share, open, and then view edits in real time. This essentially means Photoshop and other Creative Cloud (CC) applications don't need to be actively running to allow users to share edits. This functionality is great for on-the-go teams, remote teams, and teams with clients that work in different locations. The new Photoshop has greatly improved selection with the new, intuitive and easier-to-use, one-click selection tool. Using a new, intuitive interface, the new tool uses machine learning algorithms to detect objects and automatically highlight those objects. With an improved, one-click selection tool, you can now get more creative with your selection. Send us a comment about the new one-click move tool .

Popular browser-based features include:

- Simplified mapping of Photoshop icons to browser icons
- Full-featured PSD (Photoshop) files are synced with desktop files and you never lose any of your work
- Photoshop is licensed on a per-user basis so the file gets sent to a single user. So working with a colleague is much more practical and convenient
- You can open, close and save files without needing to copy it between windows
- Files can be compared and synchronized across all desktop and web platforms without needing to download them
- And more …

Trace to new native browser APIs and the web engine that are the future of websites, many powerful features and capabilities of Photoshop are being migrated over to web browsers on and off desktop platforms. Web Preview's higher resolution and pixel-for-pixel accuracy, the ease of workflow and content editing across both desktop and the web, and the convenience of saving designers and webmasters from having to learn two different tools -- one for web (Photoshop) and one for desktop (Illustrator) -- are just a few of the benefits hosting the web edition of Photoshop enables. Photoshop's new web-based workspace is available through a dedicated web browser window to web users. This allows web users to access Photoshop with the same ease-of-use, workflow, and experience that can be achieved on a desktop operating system and the usual web browser. The experience is identical to desktop users, and is made possible thanks to the web browser's low overhead and security-free nature.
